

# **Universal Web Parser**

**Aleksei Rziankin 2025**

A Software-as-a-Service (SaaS) platform that runs your Kotlin scripts on schedule - complete with helper APIs for web parsing.

## **Main features:**

### **Dynamic scripting**

Compile and run Kotlin scripts on the fly - adjust parsing logic anytime without redeploying.

### **Real-time feedback**

Live WebSocket updates deliver compilation errors, logs, and UI updates instantly.

### **Structured output**

Access parsed data as clean JSON objects through REST endpoints.

# Dashboard

## Live Logs

```
23:04:01 Starting script 17
23:04:02 Compiling script 17
23:04:02 Successfully compiled script 17
23:04:02 S17> Hello from Script 1
23:04:04 Script 17, Execution status: SUCCESS
```

## Script API

Each script has access to the following API, managed by the Parser:

**println(Any)** – Outputs any object to the web console.

**page** – A ready-to-use Playwright Page instance. Autosaves cookies and sessions.

**store** – Provides access to state:

**fun load(): MutableMap<String, String>** – Reads the map from disk.

**fun save(map: Map<String, String>)** – Saves the map to disk.

**val memoryMap: MutableMap<String, Any>** – A singleton in-memory map.

**fun isThrottled(url: String, hours: Int): Boolean** – Returns true on the first invocation, then false until the specified time has passed.

**The End**
